

What's *new* in Augmented Team this week

Seven shipped upgrades — the quick tour.

See your agents work, *live*

Live progress streams onto your kanban cards — and you can pop open a live terminal view of any agent in real time.

Hand work back to a *human*

Agents can now assign kanban tasks to teammates, so work that needs a person lands on the right plate.

A *refreshed* Direct Chat

A rebuilt Direct Chat drawer for smoother, faster back-and-forth with your agents in the webapp.

Safer, self-improving skills

Every new skill is auto security-scanned before it goes live — and agents learn from memory to sharpen over time.

Stronger *human-in-the-loop*

Separation-of-duties enforcement, auto-approve rules, and agents that request access before sensitive actions.

Run agents in *your own* AWS

Guided bring-your-own-cloud enrolment deploys agent hosts into your own AWS account — your compute, your data.

Sharper admin & reliability

Richer dashboards, per-agent timezones, audit-logged restarts, and dependable replies across every channel.

INSTALL THE COMPOUNDING EDGE

Put it to *work* for your team

Reply and we'll help you turn any of these on — first agent live in 14 days.
